

Mediterranean ungulates

Directed by: G. Pancaldi, M. Massetti, A. D'Onofrio

Produced by: SD Cinematografia

Duration: 26'

Versions: 

Format: HD

Ever since man became a shepherd, he has been moving animals from one continent to another, thus favoring crossbreeding and adaptation to new environments. This is what seems to have happened to a species of goat that was introduced into the Mediterranean from Asia Minor and found ideal living conditions on the islands of Crete and Monte Cristo. The film illustrates the differences and similarities of the various types of goats found among the steep, dangerous coasts of these marvelous islands. There also exist some species that seem to be absolutely indigenous in several regions. Our troupe filmed the Corsican deer which, unfortunately, owes its fame to the fact that it is in danger of extinction. Studies of these animals serves as a pretext for a wider panorama of ungulates in general.
